

## ABSTRACT OF THE DISCLOSURE

The invention relates to a self-inking stamp filled with ink by the top thereof at a pressure. The inventive stamp comprises a housing and a stamping unit which is connected to an actuating element, movably arranged in the housing and provided with stamping characters. The housing also comprises a drawer which is provided with at least one pushing opening through which an inkpad container can be inserted. The drawer is provided with an opening on the lower side thereof in front of the stamping unit, which makes it possible to ink the stamping characters in an upward turned position by applying them to the ink pad which is arranged in the container thereof. The invention is characterised in that, guiding and centring projections for the ink-pad container are arranged in an insertion direction on two opposite sides of the drawer.
